

Marstrom Composite - Vision. Marström Composite is strongly connected with marine business. The company's first product was the Olympic Tornado and the autoclave technology was incorporated from the start.

The focus over the years has been spread over three different areas; Boats, Spars and Industry. The first boats were made in 1984 and the first masts and industrial applications a few years later. Each Area is carefully developed side by side, and the knowledge from each area will benefit the others. We feel that it's very important to have a wide experience in order to create the best products in all the three areas.

The vision is to expand all the three areas side by side and develop it altogether. We will always try to have a mixture of own created products and subcontract work. Especially the Industrial part is 100% subcontract work. We are very often involved in the process early to help and guide the customer to the best result.

Both small and big Boats can be manufactured in our facilities. So far multihull boats between 18 and 90 foot have been produced.

Also so far, all types of spars from 5,5m to 40 m of length have been produced. There is no limit in size for us, since the technology to join two pieces is commonly used. However, when it comes to transport practicalities it is best to stay under about 40 meters per piece.

The industrial area is our broadest business area. You can find all kind of products here, such as

- Cargo panels for Boeing and Airbus
- Medical equipment
- Oil prospecting equipment
- Camera bodies

And a lot of other products in the most versatile areas.

Every day, Marstrom Composite is confronted by exciting new challenges and demands for unusual products. In most cases, we succeed in meeting our customers' needs!

Welcome to put us on test!
